

Major Vegetation Types of the World

Geography Bee Study Sheet — for Rishabh

Tropical Rainforest

Hot and very wet, near the equator. Tall, dense evergreen trees. Most kinds of plants and animals on Earth!

Amazon, Congo, SE Asia

Tropical Grassland (Savanna)

Tall grasses with a few scattered trees. Wet and dry seasons. Home to lions, elephants, zebras.

East Africa, India, Brazil

Temperate Grassland

Short grasses, almost no trees. Great for farming wheat and grazing.

Prairies, Steppes, Pampas, Veld

Desert

Very dry, little rain. Cactus and thorny shrubs that store water.

Sahara, Thar, Gobi, Atacama

Mediterranean

Wet mild winters, dry summers. Olives, grapes, citrus fruits.

Med. Sea, California, Chile

Temperate Deciduous Forest

Trees that drop their leaves in autumn — oak, maple, beech.

East USA, W. Europe, China

Coniferous Forest (Taiga)

Cone-bearing evergreens with needle leaves — pine, fir, spruce. World's largest forest belt!

Canada, Russia, Scandinavia

Tundra

Very cold, near the poles. No trees — only mosses, lichens, tiny shrubs.

N. Canada, Russia, Greenland

Mountain (Alpine)

Plants change with height: forest → grass → snow at the top.

Himalayas, Alps, Andes

Memory Trick: As you travel from the **Equator to the Poles**, vegetation changes: Rainforest → Savanna → Desert → Grassland → Forests → Taiga → Tundra → Ice
